CandiVue AI — Detailed System Workflow

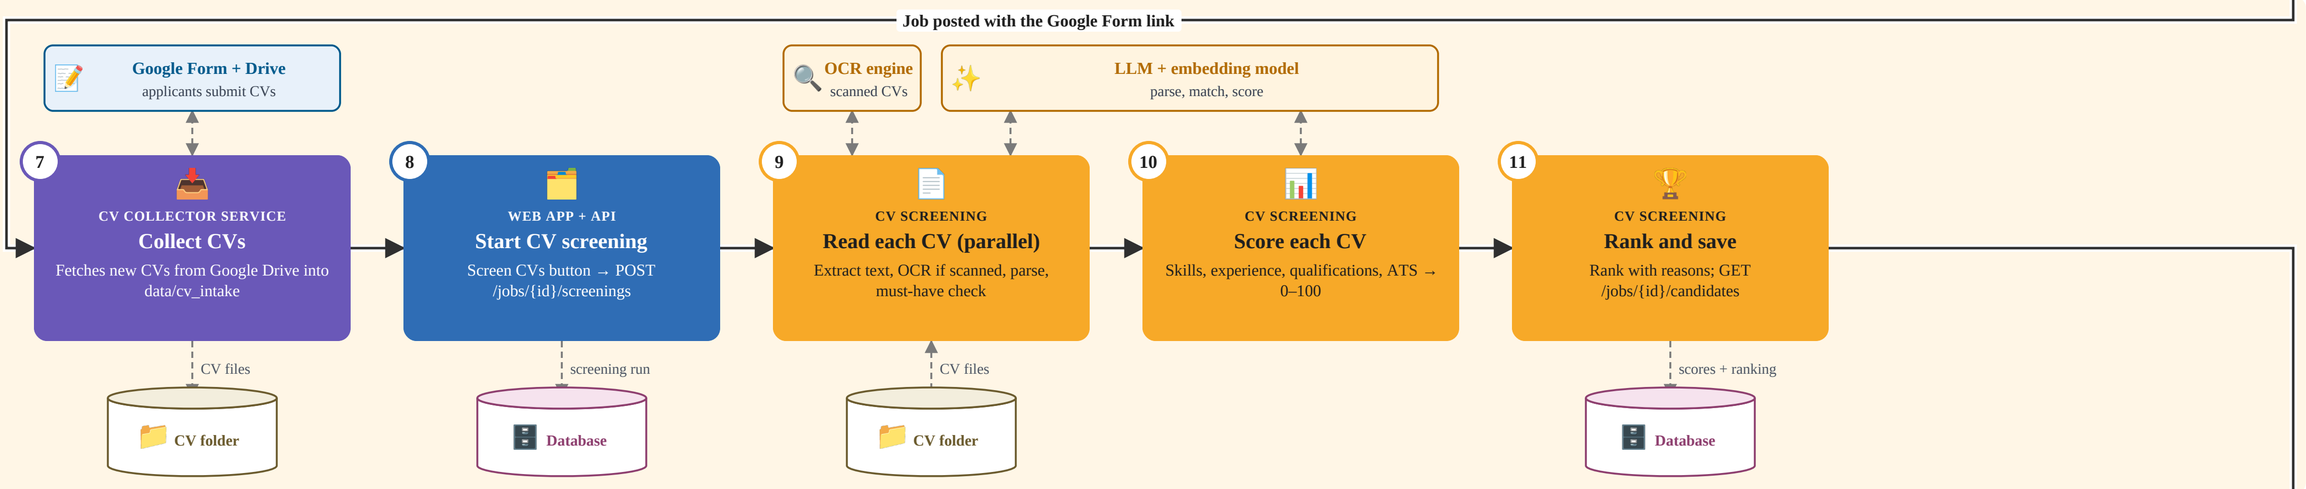

1. Prepare the Job

Hiring Assistant (LangGraph 1)

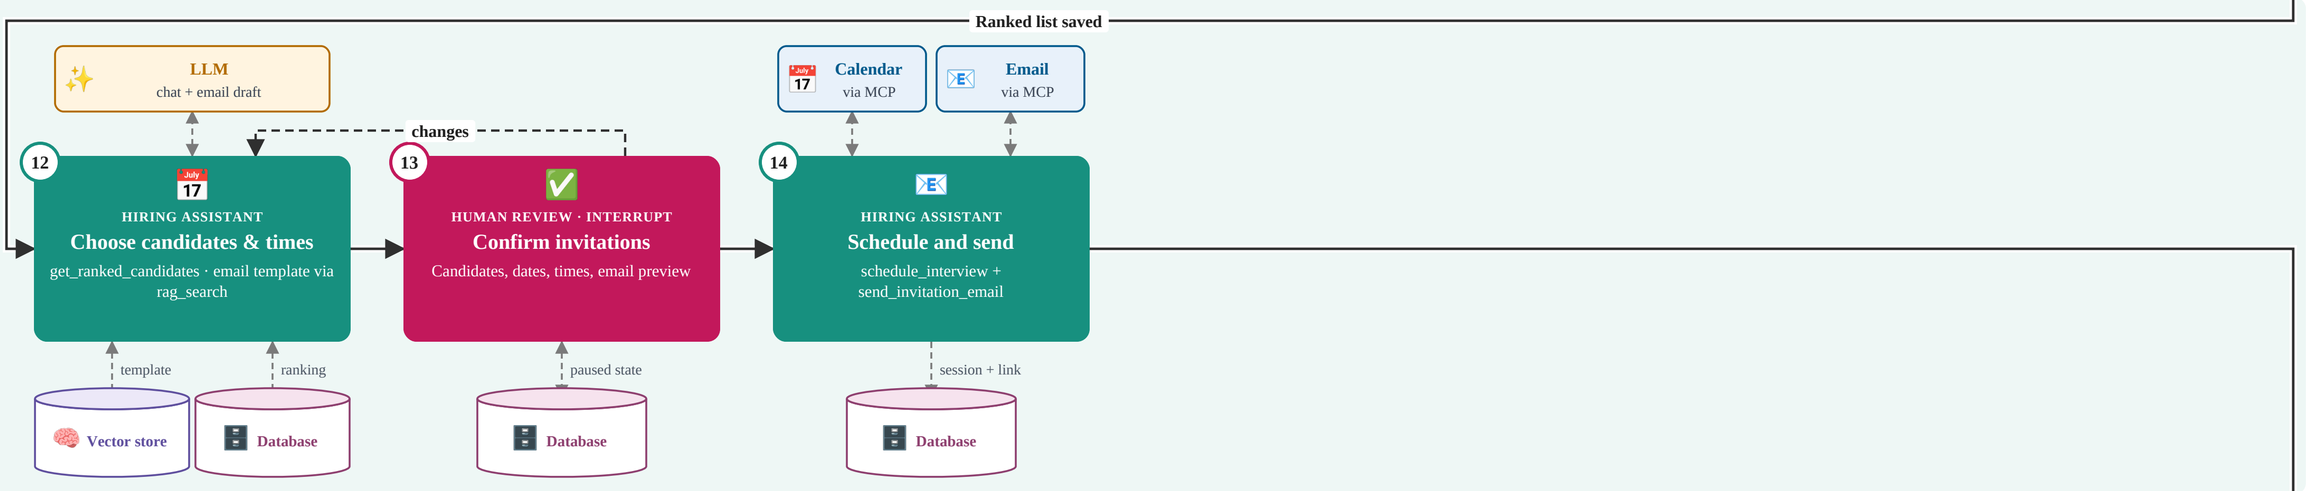

2. Collect and Screen CVs

CV Collector service + CV Screening (LangGraph 2)

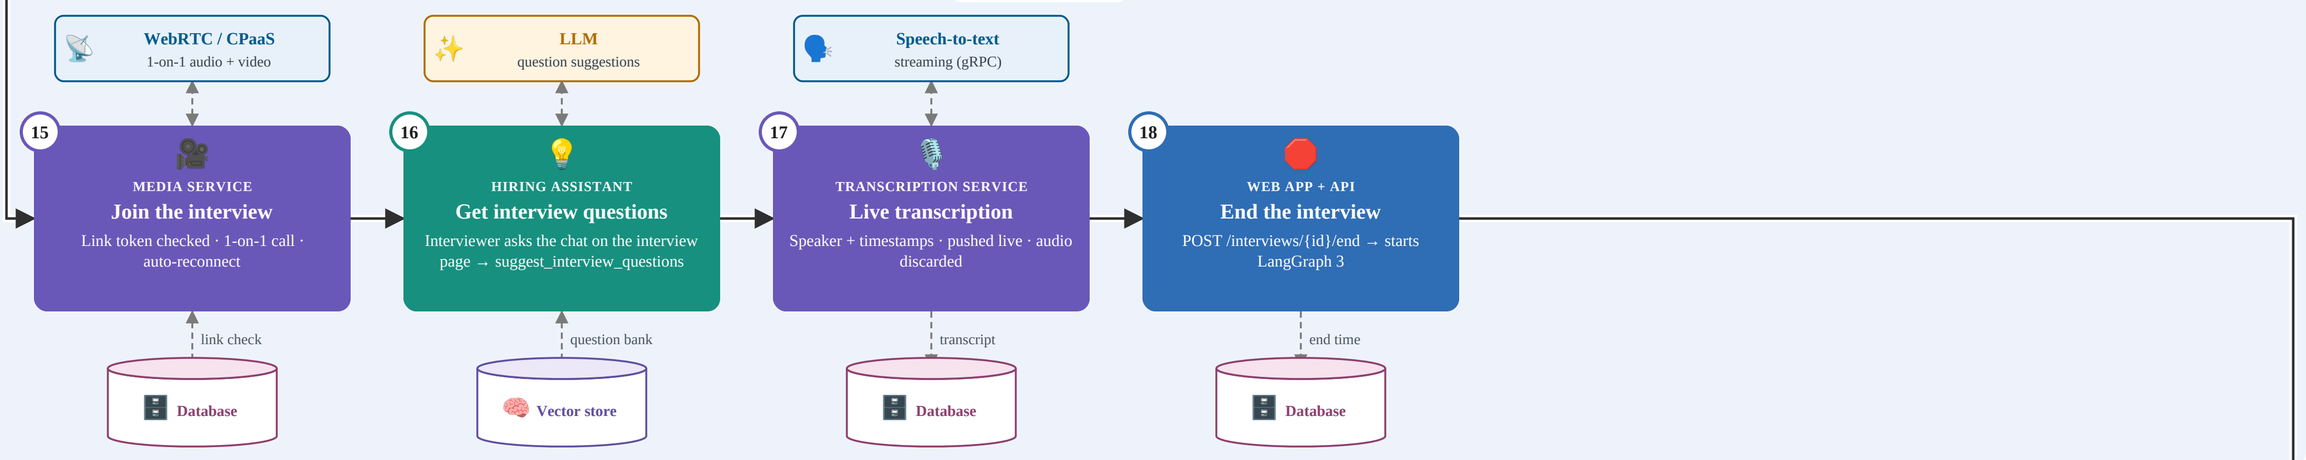

3. Invite Candidates

Hiring Assistant (LangGraph 1)

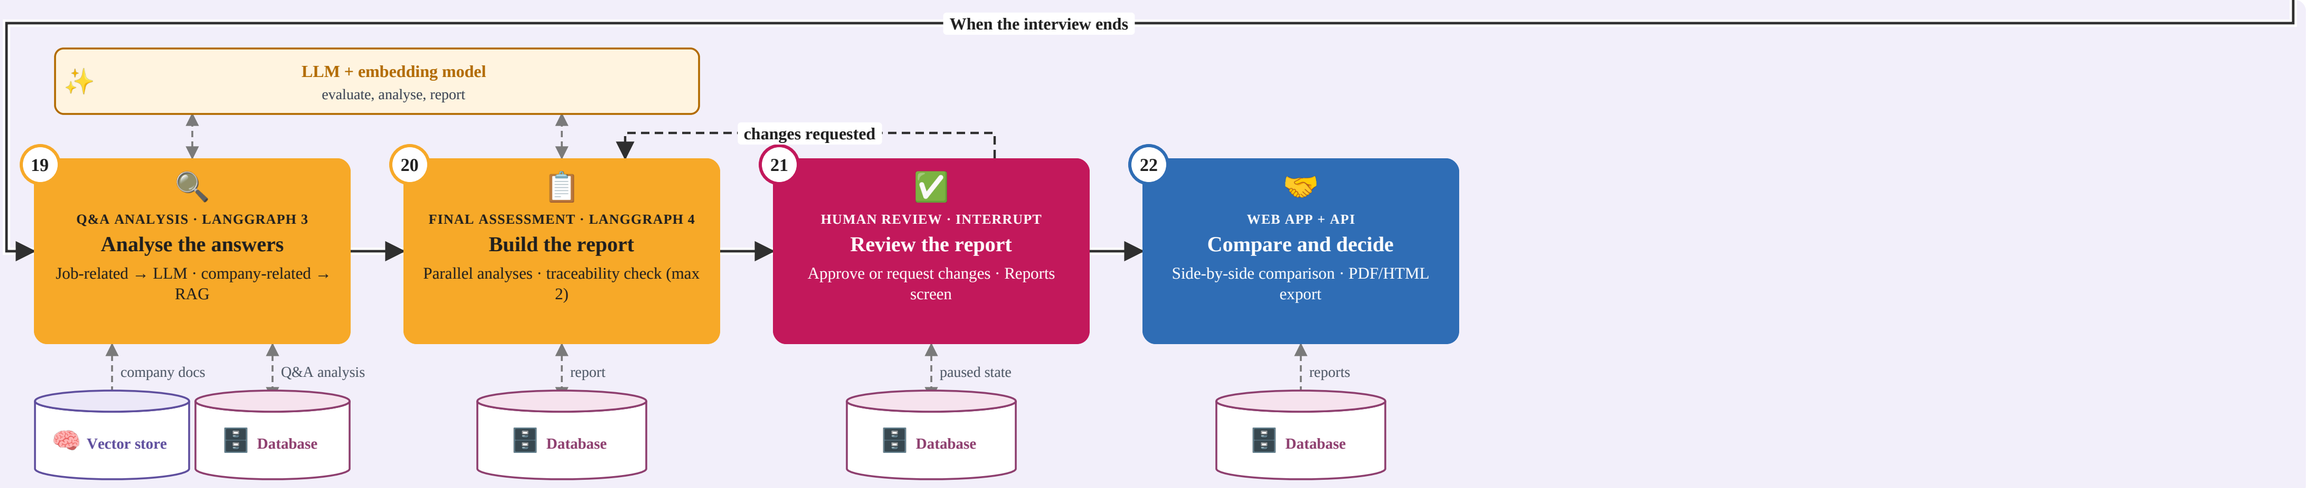

4. Hold the Interview

Real-time services + Hiring Assistant

5. Assess and Decide

LangGraphs 3 and 4

Steps: Web App + API (FastAPI) · Hiring Assistant chatbot (LangGraph 1) · Human review (LangGraph interrupt) · Background LangGraph workflows (2, 3, 4) · Backend services (CV collector, media, transcription)

Connections: next step · arrow points the way data goes (both ends = read and write) · loop back after review · AI model · external service · data store: Database (PostgreSQL) · Vector store · CV folder

The Hiring Assistant keeps one LangGraph thread per job; human reviews pause the run and resume from the database checkpoint. LangGraphs 2–4 are started by the application, not the chatbot. Endpoint names are suggested.
